EDUCATION

PES University

B.Tech in Computer Science

Bengaluru, India

August 2018 - August 2022

- Cumulative GPA: 8.32
- Recognitions: MDR scholarship (2x), Distinction award (2x)

WORK EXPERIENCE

Independent Software Engineer

Freelance — AI, full-stack & embedded product delivery

Remote

2025 – Present

- Delivered production software for 10+ clients across AI SaaS, wellness, travel, embedded systems, and health data; shipped 2 iOS apps to the Apple App Store.
- **SoulTalk (sole developer)**: built an LLM wellness platform end to end — async FastAPI backend (~32k LOC), React Native iOS app, and all infrastructure — from blank repo to public App Store launch (US + Canada) in ~6 months, ~808 commits across 4 repos; streamed AI responses over WebSockets with 30–50% lower input-token cost, durable idempotent job queues, and GDPR-grade export/erasure.
- **Movo (AI enrollment platform)**: 548 commits in 3 months as the backend's second most active contributor; built the pgvector RAG knowledge base (HNSW, content-hash dedup), an LLM insights engine, multi-dimensional lead scoring, and 3 CRM integrations (Salesforce via Merge, LeagueApps with an audited browser write-bridge, Mindbody); executed a zero-downtime dual-write migration of the system's busiest table.
- **Rahee (frontend lead)**: rebuilt Meta ad attribution natively for a Capacitor + React iOS/Android app, cut the Android bundle ~40%, replaced flaky hosted CI with an automated TestFlight → App Store pipeline, and shipped an SSE-streamed conversational booking UI.
- **Nyxiidom (embedded)**: built the entire Raspberry Pi side of a container-return kiosk (100% of the code by git blame at handoff): custom UART protocol to STM32, five-sequence control loop, offline-first server sync with audit trail, and a 677-line hardware simulator.
- **Cipherome**: custom Eclipse Dataspace Connector data plane with Keycloak IAM for secure genomic data exchange.

Societe Generale

Software Engineer

Bengaluru, India (Remote)

July 2022 – February 2026

- Worked fully remote for 3.5 years as one of two India-based developers on a 15-member France–India team inside a 50+ member platform group, maintaining 90% sprint-commitment completion.
- Drove the bank's migration of a mission-critical regulatory data platform from an on-premise Java 8 monolith to Java 17 Spring Boot microservices on AWS, carried through to pre-production; reduced deployment time by 20%.
- Developed and maintained 5+ microservices processing 50K+ daily transactions; designed PostgreSQL schemas and optimized queries, cutting API response times by 15%.
- Built the React + TypeScript front-end that replaced a legacy JSP application for 1,000+ daily users, improving UI responsiveness by 25%.
- Worked with Databricks for analytics pipelines; deployed containerized applications via Jenkins CI/CD to AWS ECS/ECR, debugging with CloudWatch and managing configuration through Secrets Manager.
- Implemented comprehensive logging across microservices, reducing production debugging time by 30%; performed code reviews on a team of 8, holding coverage above 70% with SOLID principles.

PWC (PriceWaterhouseCoopers)

Software Engineer Intern

Bengaluru, India

January 2022 – June 2022

- Developed a Python desktop application (Tkinter, MVC) for an internal team, reducing manual data-entry time by 15%; SQLAlchemy ORM over MySQL improved query response time by 20%.
- Carried 2 proof-of-concept projects from requirements gathering through stakeholder demos to deployment on Windows Server via IIS and Apache.

PROJECTS

United Majdoors: Command centre for a fleet of AI coding agents

January 2026 – Present

- Built a browser command centre operating 50+ autonomous Claude agent seats across 11 projects, on top of Steve Yegge's open-source Gas Town: live agent terminals streamed over WebSockets (node-pty + xterm.js), a kanban of durable work items, a central cross-workspace message relay, and push notifications — 45k+ lines of TypeScript on Next.js.
- The fleet ships real software: the portfolio at [vidish.online](#) — including its case studies — is written, reviewed, and deployed by agents operating inside it.

Akkountant: AI-powered personal wealth platform

December 2022 – Present

- Auto-ingests statements from 6 banks via Gmail and tracks 6 investment types (11k+ transactions parsed); a Claude agent with MCP tools reads uploaded receipts and statements, answers portfolio questions, and files investments conversationally, alongside a daily AI wealth digest.
- Run like production: zero-loss coverage gates on every market-rate feed (112-test regression suite), nightly processing windows, and job health dashboards. Stack: Flask/FastAPI, React, MySQL, Claude SDK, MCP.

Makaan: Real-estate market intelligence

2026

- Aggregated and de-duplicated ~300,000 live listings from three Indian property portals into one dashboard — price maps, buy-vs-rent analytics, comparable-based valuations, and an AI analyst that grounds every answer in live SQL — built solo in about five weeks (~14.5k LOC, TypeScript/Node + SQLite).

Also built: **TripSplit** (multi-currency trip ledger with an 11-tool Claude agent operator), **Satte Nights** (real-time multiplayer poker PWA, server-authoritative), and this portfolio. Case studies for all: [vidish.online](#).

TECHNICAL SKILLS

AI & Agents: Claude Agent SDK, MCP, OpenAI SDK, RAG (pgvector, HNSW), agentic tool design, prompt-injection hardening, LLM cost/latency optimization

Languages: Python, TypeScript, JavaScript, Java, SQL, C++, C

Backend: FastAPI, Flask, Spring Boot, Node.js, Express, SQLAlchemy, Prisma, Socket.IO, Redis, BullMQ, REST APIs

Frontend & Mobile: React, Next.js, React Native (Expo), Capacitor, Tailwind, MUI, Framer Motion

Databases: PostgreSQL, MySQL, SQLite, pgvector, Databricks

Cloud & Ops: AWS (ECS, ECR, RDS, S3, Secrets Manager), Docker, GitHub Actions, Jenkins, Nginx, systemd, Oracle Cloud

Embedded: Raspberry Pi, STM32, UART, Linux evdev

LANGUAGES

English (Full working and professional proficiency)
